

Actydon I MPC

Platinum Catalyst on Mesoporous Carbon for High Power Density

Buckle up for high performance!

Heraeus' new catalyst on a mesoporous carbon support for high stack power density and full-load performance.

High catalytic activity:
High performance at low and intermediate current densities

Reliable power density:
Effective operation at high current densities

Developed for wet operation:
Effective operation at high-humidity and wet conditions

Actydon I MPC

A catalyst designed for high performance and high current density

- Mesoporous carbon support selectively chosen by Heraeus to optimize catalytic performance
- High activity at low and intermediate current densities supports fuel efficiency.
- Mass transport properties stand out under wet operating conditions and at high current densities.
- Less active area needed for the same rated power can lower material costs.

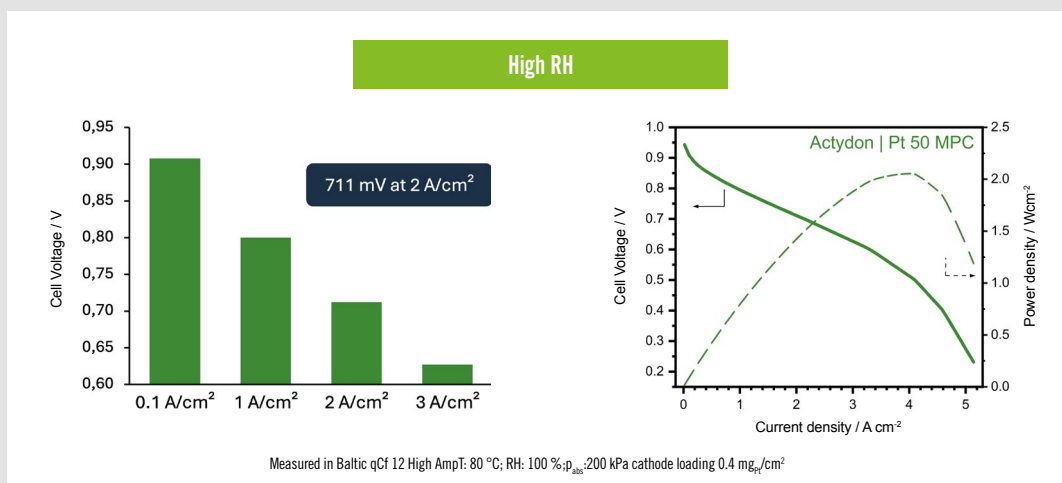

NEW

Reliable power density

Actydon I MPC

High catalytic activity

Developed for wet operation
